Laravel - Ciclo de vida simplificado

Artisan Console

Artisan é uma interface de linha de comando incluída no Laravel, ela fornece vários comandos úteis que podem ajudá-lo enquanto você desenvolve sua aplicação

php artisan list

php artisan tinker

```
Psy Shell v0.9.9 (PHP 7.2.17-0ubuntu0.18.04.1 - cli) by Justin Hileman
```

php artisan make:model Foo

Model created successfully.

php artisan make:migration foo

Created Migration: 2019_05_17_004924_foo

php artisan make:model Foo

Model created successfully.

php artisan make:migration create_foos_table

Created Migration: 2019_05_17_005031_create_foos_table

php artisan make:factory FooFactory -m Foo

Factory created successfully.

php artisan make:model Foo -m

Model created successfully.

Created Migration: 2019_05_17_010101_create_foos_table

php artisan make:controller FooController

Controller created successfully.

php artisan make:controller FooController -r

Controller created successfully.

php artisan make:controller \
FooController -r -m Foo

Controller created successfully.

Route Model Binding

php artisan make:model Foo -crm

Model created successfully.

Created Migration: 2019_05_17_013050_create_foos_table

Controller created successfully.

php artisan make:model Foo -a

Model created successfully.

Factory created successfully.

Created Migration: 2019_05_17_013809_create_foos_table

Controller created successfully.

php artisan make:request FooStoreRequest

```
php artisan make:model Models/Foo -a
php artisan make:request Foo/StoreRequest
```

Artisan Console - O PRINCIPAL!

php artisan help [comando]

Eloquent Laravel ActiveRecord

Eloquent

```
Foo::all(): Collection
```

Foo::find(\$id): Foo

Foo::first(): Foo

Foo::paginate(\$perPage = 25): Paginator

Eloquent - Where Aninhado

```
Foo::where('active', true)
   ->where('is_admin', false)
   ->where('foo', '=', 'bar')
   ->whereIn('id', [1,2,3])
   ->get()
```

Eloquent - Array de condições

Eloquent - Agrupamento de Parâmetros

```
Foo::where('is_admin', true)
->where(function(Builder $q){
   $q->where('age', '>', 80);
   $q->orWhere('age' '<' 17),
})->get()
```

Eloquent - whereX

```
Foo::where('email', $email)->first();
```

Foo::whereEmail(\$email);

Eloquent - Raw Queries

```
Foo::whereRaw('is_admin = ? and active = ?', [true, true])
->get()
```

Eloquent - Date Queries

```
Foo::whereRaw('extract(year from created_at) = ?', 2019)
->whereRaw('extract(month from created_at) = ?', 5)
->whereRaw('extract(day from created_at) = ?', 18)->toSql()
```

Eloquent - Date Queries

Foo::whereYear(2019)->whereMonth(5)->whereDay(18)->get()

Eloquent - Query Debug

```
Foo::where('is_admin', true)
->where(function(Builder $q){
    $q->where('age', '>', 80);
    $q->orWhere('age' '<' 17),
})->toSql()
"select * from `foos` where `is_admin` = ? and (`age` > ? or `age` < ?)"</pre>
```

Eloquent - Incremento e Decremento

Eloquent - Incremento e Decremento

Eloquent - Incremento e Decremento

```
$foo = Foo::find(1);
$foo->increment('count', 10);
```

Eloquent - Métodos XorY

```
$foo = Foo::find(1);
if( ! $foo) {
    return abort(404);
}
-----
$foo = Foo::findOrFail(1);
```

Eloquent - Métodos XorY

```
$foo = Foo::whereEmail('foo@bar.com')->first();
if( ! $foo) {
    $foo = Foo::create(['email' => 'foo@bar.com']);
}
-----
$foo = Foo::firstOrCreate(['email' => 'foo@bar.com']);
```

Eloquent - Métodos XorY

```
Foo::firstOrNew([...])
Foo::firstOrCreate([...])
```

Eloquent - Query Scope

Deploy de Aplicação - Manual

- 1. Acessar servidor Remoto (SSH)
- Para primeiro deploy:
 - a. Clonar o projeto
 - b. Instalar o projeto
 - c. Configurar variáveis de ambiente (.env)
- 3. Para os demais deploy's
 - a. atualizar o projeto

Em paralelo já ter o servidor HTTP configurado.

Deploy de Aplicação - Semi-Automático

Utilizando o Deployer: https://deployer.org/

- Apenas no primeiro deploy
 - a. php artisan deploy -s firstdeploy
 - b. acesso remoto ao servidor e configurar variáveis de ambiente (.env)
- 2. Para os demais deploy's
 - a. php artisan deploy

Deploy de Aplicação - Automático

GitLab

Obrigado!
